Automating Knowledge Acquisition for Expert Systems Sandra Marcus 2013-03-08 In June of 1983, our expert systems research group at Carnegie Mellon University began to work actively on automating knowledge acquisition for expert systems. In the last five years, we have developed several tools under the pressure and influence of building expert systems for business and industry. These tools include the five described in chapters 2 through 6 - MORE, MOLE, SALT, KNACK and SIZZLE. One experiment, conducted jointly by developers at Digital Equipment Corporation, the Soar research group at Carnegie Mellon, and members of our group, explored automation of knowledge acquisition and code development for XCON (also known as R1), a production-level expert system for configuring DEC computer systems. This work influenced the development of RIME, a programming methodology developed at Digital which is the subject of chapter 7. This book describes the principles that guided our work, looks in detail at the design and operation of each tool or methodology, and reports some lessons learned from the enterprise. of the work, brought out in the introductory chapter, is A common theme that much power can be gained by understanding the roles that domain knowledge plays in problem solving. Each tool can exploit such an understanding because it focuses on a well defined problem-solving method used by the expert systems it builds. Each tool chapter describes the basic problem-solving method assumed by the tool and the leverage provided by committing to the method.

Readings in Knowledge Acquisition and Learning Bruce G. Human Performance and Ergonomics Peter A. Hancock 1999-04-13 *Human Performance and Ergonomics* brings together a comprehensive and modern account of how the context of performance is crucial to understanding behavior. Environment provides both constraints and opportunities to individuals, such that external conditions may have reciprocal or interactive effects on behavior. The book begins with an account of research in human factors and engineering, with application of research to real world environments, methodological concerns, and rumination on current and future trends. The book proceeds to how technology has moved from being designed to help human physical

survival to helping humans achieve "quality of life" improvements. Real world examples are explored in detail including hearing technology, driving, and aviation. Issues of control, maneuvering, and planning are discussed in conjunction with how intention and expectancy affect behavior. The fit between human and environment is examined as a dynamic interaction, and many chapters address the all important human-machine communication, particularly that between humans and computers. The book closes with a reminder that even our technological environment is filled with other people, with whom we must interact personally or via technology, to achieve our larger goals. Teamwork is thus discussed for its integration of cognitive, behavioral, and affective components toward our achieving desired aims.* Includes the application of research in human factors in engineering to real world environments* Discussion of both current and future trends is included* Real-world examples of how technology is now helping humans to achieve "quality of life" improvements are explored in detail including hearing technology, driving and aviation* Many chapters examine the all important human/machine communication, particularly human-computer interaction (HCI)
