Android Malware Detection using Machine Learning ElMouatez Billah Karbab 2021-07-10

The authors develop a malware fingerprinting framework to cover accurate android malware detection and family attribution in this book. The authors emphasize the following: (1) the scalability over a large malware corpus; (2) the resiliency to common obfuscation techniques; (3) the portability over different platforms and architectures. First, the authors propose an approximate fingerprinting technique for android packaging that captures the underlying static structure of the android applications in the context of bulk and offline detection at the app-market level. This book proposes a malware clustering framework to perform malware clustering by building and partitioning the

similarity network of malicious applications on top of this fingerprinting technique. Second, the authors propose an approximate fingerprinting technique that leverages dynamic analysis and natural language processing techniques to generate Android malware behavior reports. Based on this fingerprinting technique, the authors propose a portable malware detection framework employing machine learning classification. Third, the authors design an automatic framework to produce intelligence about the underlying malicious cyber-infrastructures of Android malware. The authors then leverage graph analysis techniques to generate relevant intelligence to identify the threat effects of malicious Internet activity associated with android malware. The authors elaborate on an effective android malware

detection system, in the online detection context at the mobile device level. It is suitable for deployment on mobile devices, using machine learning classification on method call sequences. Also, it is resilient to common code obfuscation techniques and adaptive to operating systems and malware change overtime, using natural language processing and deep learning techniques. Researchers working in mobile and network security, machine learning and pattern recognition will find this book useful as a reference. Advanced-level students studying computer science within these topic areas will purchase this book as well.

An Analysis of Android Malware Detection Using Tree Learning Techniques Kyler D.

Dickey 2022 Android malware is a growing threat, coinciding with the increasing adoption of the Android platform. Malware detection methods used to maintain user privacy and system integrity are increasingly becoming the subject of research. Many new methods studied

employ learning algorithms to detect malicious programs. This study investigates the use of byte and opcode frequency features as inputs for tree-based machine learning methods. The algorithm is optimized to reduce overfitting given input hyperparameter combinations and is tuned using cross-validation procedures. Lastly, the study deliberates on possible avenues for future research to gather more concrete evidence for the efficacy and cost-effectiveness of such a system in a productive environment, emphasizing the need for more strenuous testing processes.

Static Analysis for Android Malware Detection Using Document Vectors Utkarsh Raghav 2023

The prevalence of smart mobile devices has led to an upsurge in malware that targets mobile platforms. The dominant market player in the sector, Android OS, has been a favourite target for malicious actors. Various feature engineering techniques are used in the current machine learning and deep learning approaches for

Android malware detection. In order to correctly identify dependable features, feature engineering for Android malware detection using multiple AI algorithms requires a particular level of expertise in Android malware and the platform itself. The majority of these engineered features are initially extracted by applying different static and dynamic analysis approaches. These allow researchers to obtain various types of information from Android application packages (APKs), such as required permissions, opcode sequences and control flow graphs, to name a few. This information is used (as is or in vectorised form) for training supervised learning models. Researchers have also applied Natural Language Processing techniques to the features extracted from APKs. In order to automatically create feature vectors that can describe the data included in Android manifests and Dalvik executable files inside an APK, this study focused on developing a novel method that uses static analysis and the NLP

technique of document embeddings. We designed a system that takes Android APK files as input documents and generates the feature embeddings. This system removes the need for manual identification & extraction of features. We use these embeddings to train various Android Malware detection models to experimentally evaluate the effectiveness of these automatically generated features. The experiments were done by training and evaluating 5 different supervised learning models. We did our experiments on APKs from two well-known datasets, DREBIN and AndroZoo. We trained and validated our models with 4000 files (training set). We had kept separate 700 files (test set) which were not used during training and validation. We used our trained models to predict the classes of the unseen file embeddings from the test set. The automatically generated features allowed training of robust detection models. The Android malware detection models performed best with

Android manifest file embeddings concatenated with Dalvik executable file embeddings, with some of the models achieving Precision, Recall and Accuracy values above 99% consistently during development and over 97% against unseen file embeddings. The prediction accuracy of the detection model trained on our automatically generated features was equivalent to the accuracy achieved by one of the most cited research works known as DREBIN, which was 94%. We also provided a simple method to directly utilise the file present in Android APK to create feature embeddings without scouring through Android application files to identify reliable features. The resulting system can be further improved against new emerging threats and be better trained by just gathering more samples.

Cyber Security and Digital Forensics Kavita Khanna 2021-10-01 This book features high-quality research papers presented at the International Conference on Applications and

Techniques in Cyber Security and Digital Forensics (ICCSDF 2021), held at The NorthCap University, Gurugram, Haryana, India, during April 3-4, 2021. This book discusses the topics ranging from information security to cryptography, mobile application attacks to digital forensics, and from cyber security to blockchain. The goal of the book is to provide 360-degree view of cybersecurity to the readers which include cyber security issues, threats, vulnerabilities, novel idea, latest technique and technology, and mitigation of threats and attacks along with demonstration of practical applications. This book also highlights the latest development, challenges, methodologies as well as other emerging areas in this field. It brings current understanding of common Web vulnerabilities while maintaining awareness and knowledge of contemporary standards, practices, procedures, and methods of Open Web Application Security Project. It also expounds how to recover information after a

Learning Android Malware Analysis 2019 Learn the tools and techniques needed to detect and dissect malicious Android apps.

Learning Android Malware Analysis 2019 In response to the exponential growth of mobile device use, malicious apps have increased. Yet the industry is lacking professionals capable of identifying and combating these threats. Adding malware analysis to your skill set can help set you apart to employers and clients-and help you keep your users and organization safe. Security intelligence engineer Kristina Balaam introduces the basic tools and techniques needed to detect

and dissect malicious Android apps. Learn how to set up your analysis lab, with tools like APKTool, Dex2Jar, and JD-Project, and find malicious apps to deconstruct. Kristina shows how to search the codebase for indicators of malicious activity, and provides a challenge and solution set that allows you to practice your new skills.

Android Malware and Analysis Ken Dunham 2014-10-24 The rapid growth and development of Android-based devices has resulted in a wealth of sensitive information on mobile devices that offer minimal malware protection. This has created an immediate need for security professionals that understand how to best approach the subject of Android malware threats and analysis. In **Android Malware and Analysis**, **Android Malware Detection and Adversarial Methods** Weina Niu 2024-05-23 The rise of Android malware poses a significant threat to users' information security and privacy. users by employing various tactics, including deception, personal information theft, and device control. To address this issue, both academia and industry are continually engaged in research and development efforts focused on detecting and countering Android malware. This book is a comprehensive academic monograph crafted against this backdrop. The publication meticulously explores the background, methods, adversarial approaches, and future trends related to Android malware. It is organized into four parts: the overview of Android malware detection, the general Android malware detection method, the adversarial method for Android malware detection, and the future trends of Android malware detection. Within these sections, the book elucidates associated issues, principles, and highlights notable research. By engaging with this book, readers will gain not only a global perspective on Android malware detection and adversarial methods but also a detailed understanding of the

taxonomy and general methods outlined in each part. The publication illustrates both the overarching model and representative academic work, facilitating a profound comprehension of Android malware detection.

Improving the Effectiveness of Automatic Dynamic Android Malware Analysis □□□ 2013
Methods, Implementation, and Application of Cyber Security Intelligence and Analytics

Om Prakash, Jena 2022-06-17 Cyber security is a key focus in the modern world as more private information is stored and saved online. In order to ensure vital information is protected from various cyber threats, it is essential to develop a thorough understanding of technologies that can address cyber security challenges. Artificial intelligence has been recognized as an important technology that can be employed successfully in the cyber security sector. Due to this, further study on the potential uses of artificial intelligence is required. Methods, Implementation, and Application of Cyber Security Intelligence and Analytics discusses critical artificial intelligence technologies that are utilized in cyber security and considers

various cyber security issues and their optimal solutions supported by artificial intelligence. Covering a range of topics such as malware, smart grid, data breachers, and machine learning, this major reference work is ideal for security analysts, cyber security specialists, data analysts, security professionals, computer scientists, government officials, researchers, scholars, academicians, practitioners, instructors, and students.

comprehensive introduction to detecting common threats facing the Android eco-system today. Explore the history of Android malware in the wild since the operating system first launched and then practice static and dynamic approaches to analyzing real malware specimens. Next, examine machine learning techniques that can be used to detect malicious apps, the types of classification models that defenders can implement to achieve these detections, and the various malware features that can be used as input to these models. Adapt these machine learning strategies to the identification of malware categories like banking trojans, ransomware, and SMS fraud. You'll: Dive deep into the source code of real malware Explore the static, dynamic, and complex features you can extract from malware for analysis Master the machine learning algorithms useful for malware detection Survey the efficacy of machine learning techniques at detecting common Android malware categories

Android Malware Analysis & Defensive Exploitation 2025 (Hinglish Edition) A. Clarke 2025-10-07 "Android Malware Analysis & Defensive Exploitation 2025 (Hinglish Edition)" by A. Clarke ek practical aur responsible guide hai jo Android apps aur mobile threats ko analyse, detect, aur mitigate karna sikhata hai — sab Hinglish (Hindi + English mix) mein. **A Study of System Vulnerability and Malware on Android** Heqing Huang 2016 The increasing popularity of mobile devices (e.g., Android, iOS and etc.) attracts both normal users and malware writers. In this dissertation, we conduct research on three important aspects of security problems in Android, which has a lion share (about 80%) of the current mobile market. In the application-level, we perform a comprehensive analysis on the design of top 30

antivirus detectors (AVDs) tailored for Android. One latest comparison of Android AVDs from the independent lab AV-TEST reports that the AVDs have around 95% malware detection rate. This only indicates that current AVDs on Android have good malware signature databases. When the AVDs are deployed on the fast-evolving mobile system, their effectiveness should also be measured on their runtime behavior. Our new understanding of the AVDs' design leads us to discover the hazards in adopting AVD solutions for Android. First, we measure the seriousness of the discovered hazard in the malware scan operations by developing evasion techniques, which work even under the assumption that the AVDs are equipped with "complete" virus definition files. Second, we discover that, during the engine update operations, the Android system surprisingly nullifies all types of protection of the AVDs and exposes the system to high risks. We design and develop a model checker to confirm the presence of this

vulnerable program logic in all versions of Google Android source code and other vendor customized system images. We then report the findings to AVD vendors across 16 countries. In the system-level, we identify and mitigate the system vulnerabilities in Android, which cause serious denial of service (DoS). The System Server (SS) process is considered as the heart of Android, as it contains most of the Android system services in the Android framework, which provides the essential functionalities for applications (apps). However, due to the complicated design of the SS and the easily-accessible nature of its system services (e.g., through Android APIs), we conjecture that the SS may face serious DoS attacks. Through source code analysis, we have discovered a general design pattern in the concurrency control mechanism of the SS that could lead to deadly DoS attacks. As the SS plays the anchor role in Android, these DoS attacks could cause single-point-of-failure in Android. We name it

Android Stroke Vulnerability (ASV), as the SS, encounters downtime when the ASV is exploited. We then design an ASV-Hunter to rank the risk level of methods in the SS to cost-efficiently discover four unknown ASVs in critical services of SS. Our further threat analysis result is daunting: by easily writing a loop to invoke Android APIs in an app, an attacker can prevent the user from patching vulnerable banking apps, reboot the device at mission critical moments (e.g., making phone calls). The ASVs can be easily leveraged to design ransomware by putting the device into repeated freezing/rebooting loops or help equip malware with anti-removal capability. Google confirmed our findings immediately after sending them a report. We also proposed defenses to secure the SS. After identifying vulnerabilities in both critical apps and system components of Android, we consider that the vulnerable and fast evolving Android system may be the next target of malware writers. Hence, we are trying to

uncover the current status of Android malware development in the real world. We suspect that, during the malware development and testing phase, some Android malware writers are continuously using public scanning services (e.g., VirusTotal "VT") for testing the evasion capability of their malware samples, which we name Android malware development (AMD) cases. In this work, we designed an AMD hunting system in the context of VT to identify AMD cases and reveal new threats from Android malware development. Our system was implemented and used in a leading security company for four months. It has processed 58 million of Android sample submissions on VT, and identified 1,623 AMD cases with 13,855 samples from 83 countries. We then perform malware analysis and case studies on 890 samples selected from the identified AMD cases. Our case study reveals lots of new malware threats, including fake system app development, new phishing development, new rooting cases,

new evasive techniques and etc. Besides raising the awareness of the existence of AMD cases, more importantly, our research provides a generic and scalable framework for the systematic study of AMD cases on malware submission platforms. The relevant samples that we identified will become a fresh Android malware source for the research community.
