*Shell and Spatial Structures:
Computational Aspects* Guido
De Roeck 1987-03-31 In recent
years powerful engineering
workstations for a reasonable
price become a valuable tool
for the design of complicated
constructions such as shell and
spatial structures. This
availability causes an
increasing use of advanced
numerical techniques for the
static and dynamic analysis of
these structures, also in the
non-linear range. The I.A.S.S.
Working Group nO 13
concerned with "Numerical
Methods in Shell and Spatial
Structures" and the
Department of Civil
Engineering of the Katholieke
Universiteit Leuven have taken
the initiative to organise an
International Symposium,

providing a forum for
discussion and exchange of
views between researchers,
specialists in numerical
analysis on one hand and
designers, practising engineer
ings on the other hand. These
Proceedings contain the papers
presented at the Symposium,
held in Leuven, July 14-16
1986. The papers are
organised in five sections 1.
Shell structures 2. Spatial
structures 3. Dynamic analysis
4. Non-linear analysis 5.
Presentation and interpretation
of results The papers covering
more than one domain are
classified following the main
subject. We hope that
researchers as well as
practising engineers will find a
lot of useful information in the
book.

Shell and Spatial Structures

Numerical and experimental
investigations of distribution of
gaseous emissions with the air
flow in the indoor environment

Umer Afzal 2017 There are many sources of emissions produced by burning fuel for power or heat, through chemical reactions, and from leaks from industrial processes or equipment. There is always a possibility of a potential hazard when these gases enter into the indoor environment with the air flow. The determination of the concentration profiles are necessary to evaluate the potential hazard posed by the gas spread. The main objectives of this work are to develop an appropriate measurement methodology and a 3D CFD transient multicomponent simulation

model for the determination of spatial and temporal distribution of gaseous emissions with the air flow in the indoor environment. This work is also aimed at comparing the numerical simulation results of different CFD programs for a 2D base case model of indoor air flow with and without emission source under laminar and turbulent flow conditions for the purpose of developing a better basic understanding of the physical phenomena and for the selection of the suitable and appropriate CFD program for the further development of the simulation model. One of the goals is also to apply the developed simulation model to the loss prevention and risk mitigation in the indoor environment and to study the influence of different parameters on the concentration distribution of gaseous pollutants in the presence of air flow in the indoor environment to minimize the expensive and time consuming experimentation efforts.

Computational Methods in Nonlinear Structural and Solid Mechanics Ahmed K. Noor 2014-05-20
Computational Methods in Nonlinear Structural and Solid Mechanics

covers the proceedings of the Symposium on Computational Methods in Nonlinear Structural and Solid Mechanics. The book covers the development of efficient discretization approaches; advanced numerical methods; improved programming techniques; and applications of these developments to nonlinear analysis of structures and solids. The chapters of the text are organized into 10 parts according to the issue they tackle. The first part deals with nonlinear mathematical theories and formulation aspects, while the second part covers computational strategies for nonlinear programs. Part 3 deals with time integration and numerical solution of nonlinear algebraic equations, while Part 4 discusses material characterization and nonlinear fracture mechanics, and Part 5 tackles nonlinear interaction problems. The sixth part discusses seismic response and nonlinear analysis of concrete structure, and the seventh part tackles nonlinear problems for

nuclear reactors. Part 8 covers crash dynamics and impact problems, while Part 9 deals with nonlinear problems of fibrous composites and advanced nonlinear applications. The last part discusses computerized symbolic manipulation and nonlinear analysis software systems. The book will be of great interest to numerical analysts, computer scientists, structural engineers, and other professionals concerned with nonlinear structural and solid mechanics.
