Fundamentals of Global Air Transport Geography George Arbuckle 2025-04-14 The commercial air transport industry can be broadly split into three component parts: airlines, airports and aircraft. Each of these components is shaped by geography, insofar as each is influenced by places, landscapes, environments, people and their various interactions. Conversely, air transport plays a large role in shaping the various themes of geography and the position of our physical, human and environmental world. It connects people, cultures and businesses across every continent and generates economic growth, allows international trade to occur and develops tourism. It can also be involved in creating negative outputs, such as emissions, noise and loss of biodiversity, which can have a large impact on the planet and quality of life. A lack of air transport links can

also have a significantly negative impact on world regions in terms of economic and cultural development. In short, air transport and geography are inextricably linked. *Fundamentals of Global Air Transport Geography* details the geography of the global commercial air transport industry. The book aims to provide an understanding of these key areas at an introductory level, in order to be accessible to students and non-technical airport/airline management. A key theme throughout the book will not only be how geographical issues have influenced air transport, but also how air transport continues to influence geography. Each chapter boasts a range of features aimed at enhancing the reader's understanding, including learning objectives, discussion questions and case studies, and lecturers can find supporting resources including PowerPoint slides and teaching notes online.

Production Management and Business Development Bohuslava

Mihalčová 2018-12-07 Trends in economic development rely on increasing human knowledge, which stimulate the development of new, sophisticated technologies. With their utilization production is raised and the intent is to decrease natural resources consumption and protect and save our life environment as much as we can. At the same time, increasing pressure is observed both from competition and customers. The way to be competitive is by improving manufacturing and services offered to the customer. These are the major challenges of contemporary enterprises. Organizations are improving their activities and management processes. This is necessary to manage the seemingly intensifying competitive markets successfully. Enterprises apply business-optimizing solutions to meet new challenges and conditions. This way ensuring effective development for long-term competitiveness in a global environment. This is necessary for the implementation of qualitative changes in the industrial policy. "Process Control and Production Management" (MTS 2018) is a collection of research papers from an international authorship. The authors present case studies and empirical research, which illustrates the progressive trends in business process management and the drive to increase enterprise sustainability development.

The Limits of Expertise R. Key Dismukes 2017-03-02 Why would highly skilled, well-trained pilots make errors that lead to accidents when they had safely completed many thousands of previous flights? The majority of

all aviation accidents are attributed primarily to human error, but this is often misinterpreted as evidence of lack of skill, vigilance, or conscientiousness of the pilots. *The Limits of Expertise* is a fresh look at the causes of pilot error and aviation accidents, arguing that accidents can be understood only in the context of how the overall aviation system operates. The authors analyzed in great depth the 19 major U.S. airline accidents from 1991-2000 in which the National Transportation Safety Board (NTSB) found crew error to be a causal factor. Each accident is reviewed in a separate chapter that examines events and crew actions and explores the cognitive processes in play at each step. The approach is guided by extensive evidence from cognitive psychology that human skill and error are opposite sides of the same coin. The book examines the ways in which competing task demands, ambiguity and organizational pressures interact with cognitive processes to make all experts vulnerable to characteristic forms of error. The final chapter identifies themes cutting across the accidents, discusses the role of chance, criticizes simplistic concepts of causality of accidents, and suggests ways to reduce vulnerability to these catastrophes. The authors' complementary experience allowed a unique approach to the study: accident investigation with the NTSB, cognitive psychology research both in the lab and in the field, enormous first-hand experience of piloting, and application of aviation psychology in both civil and military operations. This combination allowed the authors to examine and explain the domain-specific aspects of aviation operations and to extend advances in basic research in cognition to complex issues of human performance in the real world. Although *The Limits of Expertise* is directed to aviation operations, the implications are clear for understanding the decision processes, skilled performance and errors of professionals in many domains, including medicine.
