Android Programming Concepts Trish Cornez 2015-09-25 Using a hands-on, student-friendly approach, *Android Programming Concepts* provides a comprehensive foundation for the development of mobile applications for devices and tablets powered by Android. This text explores Android Java and the Android SDK, the implementation of interactivity using touchscreen gesture detection and sensors, and current concepts and techniques for constructing mobile apps that take

advantage of the latest Android features. Each chapter features a collection of well-designed and classroom tested labs that provide clear guidance of Android concepts. Each lab is geared toward one or two specific Android concepts, which eliminated distractions and gives the reader better focus on the concepts at hand. *Attribute-level encryption of data in public Android databases* Charles E. Loftis 2013-09-24 Android mobile devices have become an attractive consumer product because of their portability, high-definition screens, long battery life, intuitive user interface, and ubiquitous competitive vendor pricing. The very feature that has helped with the proliferation of the devices is also one of the most problematic: their portability could result in theft, potentially allowing data to be compromised. For applications deployed to these devices, data security requirements need to be incorporated in the design process so these devices can be considered viable data

collection tools. Researchers at RTI have been working to secure data on Android mobile devices so that selected information on the device can be encrypted and therefore difficult to obtain illegitimately while still making confidential data easy to access. We have developed software that will encrypt specific attributes of databases residing on the internal secure digital card (SD card) of Android devices. The method we have developed could also benefit other Android applications requiring secure storage of data on globally readable and writable databases. In this occasional paper, we discuss the technologies and methods used in our Android database encryption/ decryption implementation and their potential scalability to broader applications.

of Video Instruction Android applications make use of advanced hardware and software, as well as local and server data, exposed through the platform to bring innovation and value to consumers. To protect that value, the platform must offer an application environment that ensures the security of users, data, applications, the device, and the network. Securing an open platform requires a robust security architecture and rigorous security programs, as well as developers who are aware of the security issues that may come up. Android Security Essentials LiveLessons alerts developers to the security issues that can arise when using the Android platform and guides them through solutions. Godfrey Nolan covers best practices for Android security by examining common security scenarios. Each lesson begins by presenting the concept behind the security problem at hand, with snippets of code introduced as the problem is explored. This is then followed

by examination of code or demonstration of tools showing you how to implement the concepts presented. The source code repository for this LiveLesson can be found at <https://github.com/godfreynolan/LiveLessons>. Godfrey Nolan is founder and president of RIIS, a mobile development firm in the Detroit metro area. Godfrey has spoken at AnDevCon, JavaOne, ASP-Connections, VSLive, CodeMash, Code PaLOUSA, 1DevDay, and many local Java and .NET user groups on a wide range of topics, including continuous integration, executable requirements and mobile security.
